SUMMARY

M.S. Electrical Engineering candidate specializing in power electronics, power conversion, and magnetic component design. Seeking a full-time Electrical or Power Electronics Engineering position beginning December 2026 or January 2027. Experienced in custom magnetic component design, engineering documentation, high-voltage testing, and power converter development for industrial, renewable energy, and data center applications.

WORK EXPERIENCE

L/C Magnetics Inc., Anaheim, CA

February 2026 – Present

Power Engineering Intern

- Designed custom transformers (fractional VA to 3 MVA), inductors (nH to H), and selenium surge suppressors by collaborating with senior engineers to define customer specifications and develop electrical schematics, mechanical drawings, engineering proposals, specification sheets, and product documentation for customer and manufacturing use.
- Supported engineering and sales activities by reviewing customer RFQs, preparing technical quotations, communicating customer design requirements, and processing invoices using Microsoft Excel.
- Conducted electrical performance and acceptance testing of custom transformers, inductors, and suppressors using turns-ratio testing (50/60 Hz to 400 Hz) and high-potential (Hi-Pot) dielectric testing from 1 kV to 10 kV, documenting results to verify insulation integrity and compliance with customer specifications.

Hooray Learning Center, Hacienda Heights, CA

August 2017 - July 2018

Tutor

- Led classroom-style instruction in elementary mathematics for approximately 30 students per session, delivering structured lessons aligned with curriculum standards.
- Translated complex quantitative concepts into age-appropriate explanations, improving student comprehension and engagement across diverse learning levels.
- Assessed assignments, tracked progress, and provided data-driven, individualized feedback to support measurable academic improvement.

EDUCATION

California State Polytechnic University, Pomona, CA

M.S. Electrical Engineering | August 2024 – Expected December 2026

GPA: 3.59

Relevant Coursework: Power Electronics, Advanced Power Electronics, Control Systems, Signals & Systems, Power System Analysis, Renewable Energy Systems, Embedded Systems, Communication Systems, Machine/Deep Learning

California State University, Fullerton, CA

B.S. Electrical Engineering | August 2019 - December 2023

TECHNICAL SKILLS

- **Programming & Modeling:** MATLAB, Simulink, Simscape, Python, C, C++, Assembly
- **Power Electronics & Power Systems:** DC/DC converters, PSFB, DAB, transformers, inductors, magnetic components, rectifiers, power system analysis
- **Engineering Software:** Multisim, Vivado, Keil μ Vision, LabVIEW, Visual Studio Code, Arduino IDE
- **Hardware & Instrumentation:** Oscilloscopes, Digital Multimeters, Function Generators, Turns Ratio Testers, Hi-Pot Testers, Microcontrollers, Soldering
- **CAD & Documentation:** SolidWorks, Autodesk Inventor, Microsoft Visio, Microsoft Office (Word, Excel), Adobe Photoshop, Google Workspace

SELECTED ENGINEERING PROJECTS

High-Efficiency SiC-Based 800/48 V

Isolated DC/DC Converter for AI Data Center Power Systems (Master's Project)

- Designed and simulated a high-efficiency isolated SiC-based DC/DC converter for 800 V to 48 V power conversion, evaluating Phase-Shifted Full Bridge (PSFB) and Dual Active Bridge (DAB) topologies.
- Performed efficiency, power loss, thermal, and component analyses to evaluate converter performance for AI and high-performance data center power architectures.

Bidirectional DC–DC Converter for EV Chargers

- Designed and analyzed a bidirectional DC–DC converter enabling controlled power flow between battery storage and grid-connected systems.
- Evaluated converter efficiency, voltage regulation, switching characteristics, and control performance under varying operating conditions.

1.5 MW Wind Turbine Modeling & Simulation

- Developed a system-level model of a 1.5 MW wind turbine including aerodynamic, mechanical, generator, and power electronic subsystems.
- Simulated power generation, energy conversion efficiency, and dynamic system response under varying wind conditions.
